Embeda™ (morphine sulfate)

Embeda RX ?

Embeda™ is the brand name for a new uniquely formulated abuse-deterrent opioid medication containing Morphine and Naltrexone, an opioid antagonist. When ingested, small Morphine particles within the capsule are released into the patient's system. Naltrexone, a drug used to treat opioid overdoses, is contained in the center core of each of the Morphine particles, but is designed to remain sequestered in the particle core and not be released into the patient's system. Naltrexone will only be released in large quantities if the drug is crushed or ground up for improper use, rendering the morphine ineffective. Small quantities of Naltrexone may be seen on the TOX urine or oral report when used as prescribed.
